

Obesity and Healthy Thinking Study

- **What is the study about?** This study is being done to learn if Egrifta may improve brain function in HIV positive people with abdominal obesity, which increases the risk for impaired thinking.
- **What will be done?**
 - You will be assigned to immediate versus deferred treatment with tesamorelin (Egrifta) for 6 months. There is no placebo. (Egrifta is FDA licensed for treatment of abdominal obesity in persons with HIV).
 - Your memory and ability to solve problems will be tested.
 - You will have special MRI images of your abdomen and brain before and at the completion of the 6 month period.
- **Is there compensation?** YES, for study visits and MRI testing
- **Who may be eligible?** If you:
 - Are HIV positive and are at least 40 years of age
 - Have a waist circumference of ≥ 38 inches
